LIGHTNESS

Pyla QUATTRO

Pyla CANTILEVER

From an aesthetic standpoint, Pyla Chair draws its inspiration from design objects from the Seventies and Eighties, but reviewed in a modern key. The result is a chair with well balanced aesthetic features that merges into every interior and style. Special care has been given to the choice of colour: the chair is available with bright or neutral coloured upholstery to balance the linear design features.

Such a degree of simplicity is the result of detailed research and technical features achieved the company longstanding experience. Overall, it is the result of keen and extremely precise design skills: the seat frame, for instance, is not a single unit but, instead, comprises a series of slats studied to enhance the lightness of the frame. Upholstery is pressure mounted to facilitate removal and replacement, when necessary.

FLEXIBLE / TRANSPIRANT SUPPORT

Pyla Chair has developed a concept for the backrest that actively support sitting and promote movement and transpiration.

The innovative Backrest Flexible Support is a superior elastic layer (slatted structure) that automatically conforms to distribute the proper lumbar curve of the user body, reducing pressure points across the large backrest. The flexible support provides an effective distribution of weight achieving more comfort and less stress on the back and is optionally complemented by a height adjustable lumbar support activated by conveniently locate side control.

Further the gap between the outer shell and the inner Flexible Support creates a ventilated space which allows air to pass through, thus performing excellent transpiration and heat exchange characteristics.

In order to achieve optimum support for the back, the back cushions is a soft, breathable upholstery which arches gently at the flanks of the lumbar region to provide added support. It is available in several fabric and leather finish to provide additional levels of choice, in texture and color, function and cost.
